# 花和尚鲁智深+第八章作业

# 题目:将第二讲的仿真数据集(视觉特征,imu数据)接入我们的vins代码,并运行出轨迹结果。

本节作业对第二章以及第八章的代码进行了修改,最后完整代码上传至百度云盘:

链接: https://pan.baidu.com/s/1ekyN11JdlxS9Er0-IE4oGQ

提取码: uyhk

修改思路:

### 1.修改第二节的存储函数:

- (1) 使得保存所需的IMU数据的格式符合条件,将保存后的IMU数据替换原VINS代码中的对应数据。
- (2) 将camera的时间戳单独保存至cam\_time.txt文件中,之后通过读取该文件内容,实现与imu数据中的轨迹的对齐。

#### 2.修改第八节内容:

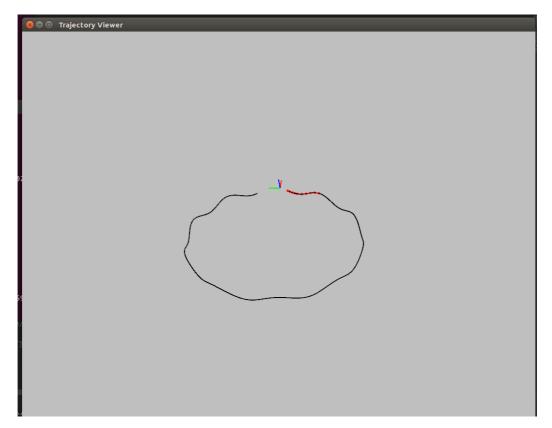

将allpoint1到allpoint599的内容的后两维读出,保存到feature\_points数据结构的归一化坐标中,跳过原图像特征检测阶段。

#### 3.在有噪声的配置文件中, 注意修改以下两点:

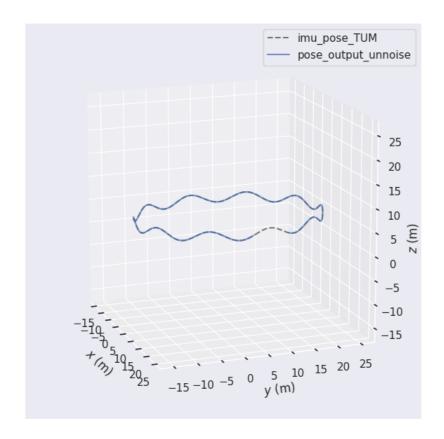

- (1) 高斯白噪声方差从连续到离散,需要乘以1/√∆t
- (2) bias随机游走方差从连续到离散,需要乘以√∆t

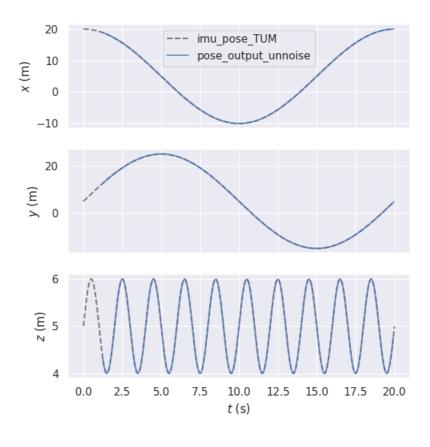

4.生成轨迹后,通过EVO工具,分别对有噪声和无噪声的情况进行比较,结果如下:

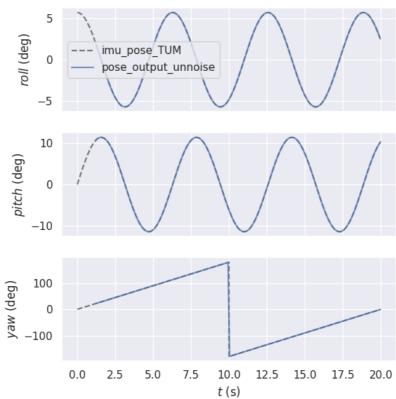

无噪声:

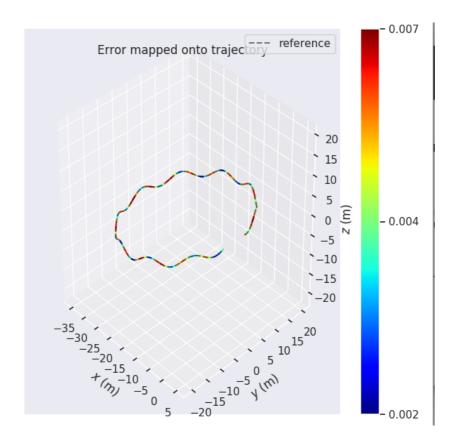

## evo*轨迹评估:*

euler\_angle\_sequence: sxyz

#### 有噪声:

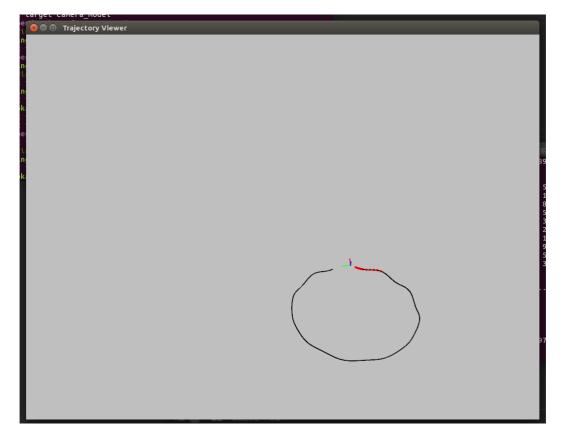

#### 设置仿真噪声为:

acc\_n: 0.019
gyr\_n: 0.015
acc\_w: 0.0001
gyr\_w: 1e-5

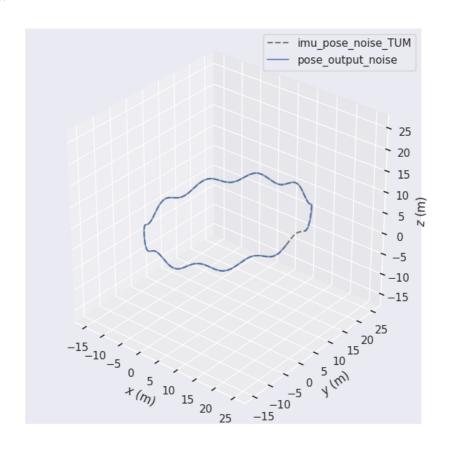

因为频率为200Hz,√200约等于14.14,需要将其在配置文件中将连续的噪声方差更改为离散的,即:

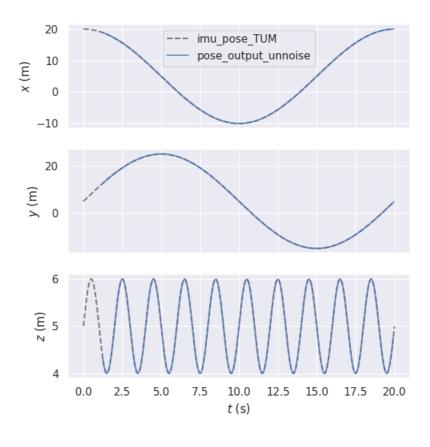

acc\_n: 0.26866 #0.019/ $\sqrt{\Delta t}$ =0.019\*14.14=0.26866 gyr\_n: 0.2121 #0.2121/ $\sqrt{\Delta t}$ =0.015\*14.14=0.2121

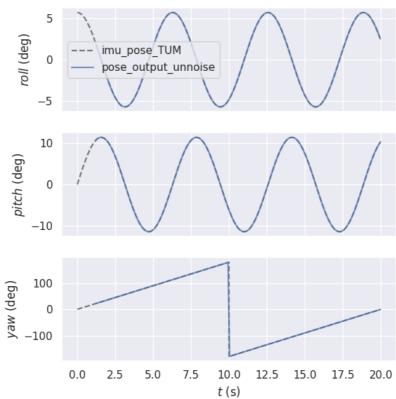

acc\_w: 7.07e-6 #0.0001/14.14=7.07e-6 gyr\_w: 7.07e-7 #1e-5/14.14=7.07e-7

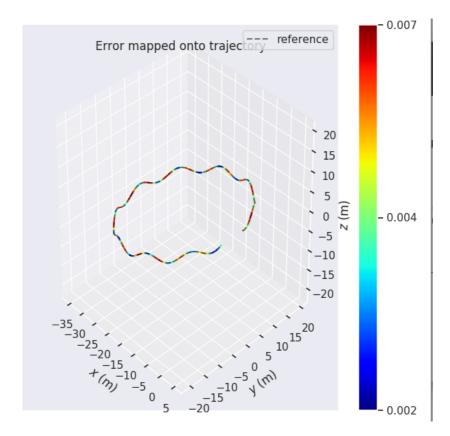

## evo*轨迹评估:*

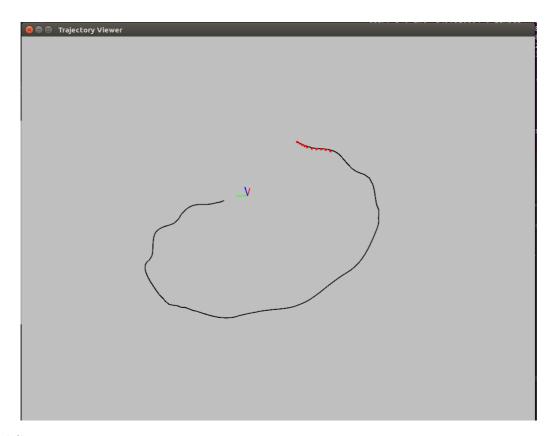

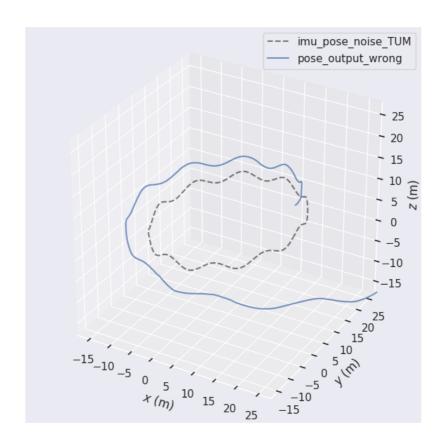

euler\_angle\_sequence: sxyz

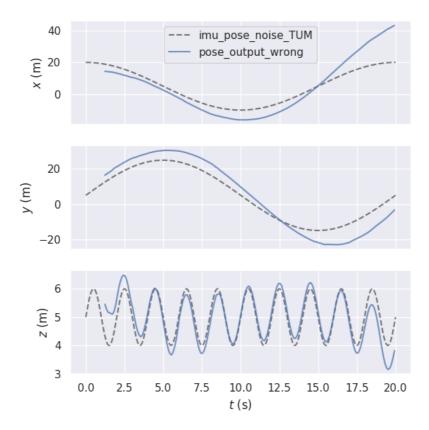

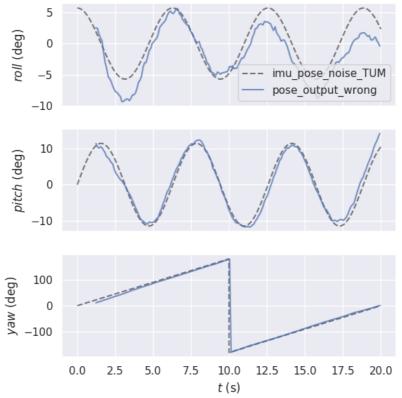

# 当yaml文件中,配置的噪声不准确时:

evo测评:

euler angle seguence: sxvz
